Openrtsp Windows Binary Download Software is used to open RTSP (Real Time Streaming Protocol) binary streams in Windows. Most streaming protocols use the RTSP transport where server initiates connections to clients. It can also be used in reverse where clients connect out to servers. RTSP packets typically carry audio or video data for one or more channels that are continuously transmitted by either the client or server. Openrtsp has many features including: peer-to-peer streaming, server configuration with port forwarding, unicast multicast and broadcast UDP/RTP streams, firewalling of multiple streams, and a scripting interface for advanced control over output processing and stream content encryption/decryption support. Openrtsp software was created by Matthew A. Chapman and is licensed under the GNU General Public License (GPL).

Open source C++ library for RTSP servers and clients. Plugin support for Flash, RealPlayer and Quick Time Player. RTSP/RTP streaming server with unicast, multicast and broadcast UDP/RTP streams. Scripting interface for advanced control over output processing and stream content encryption/decryption support. Built in firewall for multiple RTSP streams, including peer-to-peer. Latest Version: 2.0 with release year: 2012

Complete set of tools to experiment with rtsp streams in real time. RTSP streaming server with unicast, multicast and broadcast UDP/RTP streams. Scripting interface for advanced control over output processing and stream content encryption/decryption support. Built in firewall for multiple RTSP streams, including peer-to-peer. Latest Version: 1.0 with release year: 2012

Includes a server-side rtsp plugin that can be used to stream video from one rtsp to multiple players simultaneously or from a single player to many other players at the same time. Software offers full industry standard RTP 1.0 and RTCP CNAME features as well as RTSP authentication as well as secure payload encryption using AES 256bit encryption mode. Features include: This is a libavformat demuxer for Real-Time Streaming Protocol (RTSP) files. An RTSP stream is basically an MPEG-TS (MPEG transport stream) over RTP (Real-time Transport Protocol). This allows to generate or consume streams in the format used in Digital Video Broadcasting (DVB), in particular in the digital satellite world where the Eureka 147 standard allows to encapsulate many television channels into a single MPEG-2 TS/IP stream, which is then transmitted by an Analogue terrestrial transmitter, or through one or more satellite hops.

Open source implementation of the Real Time Streaming Protocol. Latest Version: 1.3 with release year: 2012

Desktop and mobile applications for streaming multimedia content on RTSP/RTP. Latest Version: 4.0 with release year: 2012

Linux-based media player that streams video and encoded audio on RTSP/RTP protocol. It can also be used to play content on VODAPs (Video Object Delivery Authentication Protocol).

RTSP client for Apple Mac OS X, developed by the CodingBlocks team, which includes a number of developers who previously worked on clients for Linux and Windows.
